- **Accelerometer:** This sensor detects movement and tilt, enabling you to create games and interactive projects that respond to physical actions.

- **Magnetometer (Compass):** This sensor measures magnetic fields, allowing you to determine direction.
- **Bluetooth:** The micro:bit features built-in Bluetooth Low Energy (BLE), allowing it to communicate wirelessly with other devices, like smartphones and tablets. This opens up possibilities for more complex projects and interaction with mobile apps. Integrating Bluetooth is a key aspect in many **micro:bit sensor integration** projects.
- **Radio:** This allows for wireless communication between multiple micro:bits, perfect for creating networked projects.

Building Your First micro:bit Project: A Simple Game

Let's create a simple game where the player controls a character on the LED screen using the buttons. This project combines button inputs and the LED display to demonstrate fundamental programming concepts. This can serve as a springboard for more complex **micro:bit programming languages** explorations.

Step 1: Open the MakeCode editor.

Step 2: Use the "on button A pressed" block and "on button B pressed" block to control a character (represented by a lit LED) moving across the screen.

Step 3: Use "show leds" or "show number" blocks to visually represent the character and its position.

Step 4: Upload the code to your micro:bit.

This is a simple example, and you can expand this project by adding scoring, obstacles, or even different game mechanics. This hands-on experience will solidify your understanding of micro:bit coding and making.
