মাইক্রোকন্ট্রোলার কীভাবে কাজ করে? (How Microcontrollers Work)

A microcontroller is a tiny computer on a single integrated circuit (IC). Think of it as a brain for embedded systems – devices that perform a specific task. Unlike general-purpose computers, microcontrollers are designed for low-power consumption and dedicated functionality. They have a central processing unit (CPU), memory (RAM and ROM), and input/output (I/O) ports. The CPU executes instructions stored in memory to control the connected devices. This **Arduino** **প্রকল্প** will heavily utilize these concepts. Many everyday devices, from washing machines to smartphones, rely on microcontrollers for their operation.

মাইক্রোকন্ট্রোলারের মূল উপাদান (Main Components of a Microcontroller):

- **CPU (Central Processing Unit):** The "brain" that executes instructions.
- **Memory (RAM & ROM):** RAM stores temporary data, while ROM stores permanent instructions.
- **Input/Output (I/O) Ports:** Allow the microcontroller to interact with external devices like sensors, actuators, and displays.
- **Clock:** Provides timing signals to synchronize operations.

উপস্থাপনকারী উপস্থাপনকারী (Structure of an Arduino Sketch):

An Arduino program, called a "sketch," consists of two main functions:

- ``setup()``: This function runs once at the start of the program to initialize variables and hardware.
- ``loop()``: This function runs repeatedly, continuously monitoring inputs and performing actions.

Example (blinking an LED):

```
``c++
```

```
void setup()
```

```
pinMode(13, OUTPUT); // Set pin 13 as output
```

```
void loop()
```

```
digitalWrite(13, HIGH); // Turn LED ON
```

```
delay(1000); // Wait for 1 second
```

```
digitalWrite(13, LOW); // Turn LED OFF
```

```
delay(1000); // Wait for 1 second
```

```
...
```

This simple program demonstrates how to control an LED connected to pin 13 of the Arduino board. This is a fundamental aspect of **মাইক্রো কন্ট্রোলার প্রোগ্রামিং**.
