Using the Silva Explorer Compass: A Step-by-Step Guide

Successfully using a Silva Explorer compass requires practice and familiarity with its components. The following steps outline a common navigation technique:

1. **Orienting the Map:** Place your map flat and align its north edge with the magnetic north indicated by your compass needle. This crucial step ensures your map accurately reflects the terrain.
2. **Taking a Bearing:** Identify your target location on the map. Using the compass's baseplate and sighting mirror (if available), align the direction of travel arrow with your target on the map. Note the bearing shown on the bezel. Your **Silva Explorer compass manual** will provide detailed diagrams for this process.
3. **Walking a Bearing:** Hold the compass level and walk in the direction indicated by the direction of travel arrow, maintaining the bearing you've established on the bezel. Regularly check your bearing to ensure you haven't drifted.
4. **Taking Back Bearings:** Periodically take back bearings (bearings to your starting point) to confirm your position. This is a valuable safety check, especially in unfamiliar terrain, and is a technique often illustrated in a **Silva Explorer compass instructional manual**.

Advanced Techniques and Troubleshooting

Beyond basic navigation, advanced techniques, such as resection (determining your position using bearings to two or more known points), are often discussed in more detailed **Silva Explorer compass guides**. Understanding these advanced techniques greatly enhances navigational proficiency.

Troubleshooting common issues, such as compass deviation caused by nearby metal objects, is essential. Always ensure your compass is away from metallic objects before taking bearings. Refer to your **Silva Explorer compass manual** for guidance on troubleshooting. FAQ: Silva Explorer Compass Questions Answered

Q1: How do I adjust for magnetic declination on my Silva Explorer compass?

A1: Magnetic declination is the angle between true north and magnetic north. Many Silva Explorer compasses have an adjustable declination scale on the bezel. Consult your **Silva Explorer compass manual** for specific instructions on how to adjust for your location's declination. Incorrectly accounting for declination can lead to significant navigational errors. Websites and apps are available to determine your location's declination.

Q2: My compass needle is spinning erratically. What's wrong?

A2: Erratic needle movement usually indicates interference from nearby metallic objects or strong magnetic fields. Move away from potential sources of interference and try again. Ensure your compass is stored properly away from strong magnets when not in use. Refer to your **Silva Explorer compass troubleshooting guide** if the problem persists.

Q3: Can I use my Silva Explorer compass in all weather conditions?

A3: While generally durable, it's recommended to avoid submerging your compass in water. Extreme cold can affect the compass needle's responsiveness. Keep it dry and avoid extreme temperatures for optimal performance.

Q4: What's the difference between a bearing and a back bearing?

A4: A bearing is the direction from your current location to a target. A back bearing is the direction from the target back to your current location. Taking back bearings is crucial for verifying your position and ensuring you are heading in the correct direction.

Q5: How do I choose the right Silva Explorer compass model for my needs?

A5: Silva offers several models with varying features. Consider your experience level and the type of activities you'll be undertaking. Beginners might opt for a simpler model, while experienced navigators may prefer models with additional features like a clinometer or sighting mirror.
